
Second Midterm Exam: Practice

Name

Please circle the section number of your lecture:

SECTION 1
MWF 9:55am
Hao Shen

SECTION 2
MWF 2:25pm
Gregory M. Shinault

SECTION 3
TuTh 9:30am
Gregory M. Shinault

- There are 5 problems on the exam, some of them have multiple parts.
- Budget your time wisely! Read the problems carefully!
- You are not allowed to use a calculator or other handheld devices.
- Please present your solutions in a clear manner. Justify your steps.
- If you need extra room, use the back of the pages.
- You may use the PMF, expected value, and variance of the Bernoulli, Binomial, Geometric, Normal, Poisson, and Exponential distributions without re-deriving the quantities. These can be treated as well known formulas.
- When there are 10 minutes left, you must remain seated until I dismiss you. This is to prevent disruptions for other students still working on their exams, and to make exam collection easier.

1. Choose a point (X, Y) uniformly at random from the triangle with vertices $(2, 0)$, $(0, 2)$ and $(4, 2)$.
 - (a) Find the cumulative distribution function of the random variable X (the x coordinate of the randomly chosen point). Be sure to specify $F(t)$ for all real values t .
 - (b) Find the density function of X . Again, be sure to specify it for all real values t .
 - (c) Calculate $P(X < 1.5 | X \leq 2)$. Complete this problem using only the CDF.
 - (d) Calculate EX .
 - (e) Calculate $\text{Var}(X)$.
2. Suppose X is a random variable with the following probability mass function:

$$p(k) = \frac{c}{k(k-1)} \text{ for } k = 2, 3, 4, 5$$

where c is some real number.

- (a) What is the value of c ?
 - (b) Find the expected value of X . Simplify your answer to a rational expression.
 - (c) Find the value of $E[X(X-1)]$. Simplify your answer to a rational expression.
 - (d) Find the standard deviation of X . Do not attempt to simplify your answer.

Hint: You can use your answers to (b) and (c) to save a little work.
3. Your history professor has made you write a 225 sentence research paper. It must be exactly 225 sentences (for some strange reason). The probability that each sentence contains a typo is $\frac{1}{100}$, independent of the other sentences.

Throughout this problem, give precise answers and do the computations by hand and with the table of normal values.

 - (a) Estimate the probability that your research paper contains 3 or more sentences with a typo.
 - (b) Your history professor hates run-on sentences. Unfortunately, the probability any particular sentence you write is a run-on is $\frac{1}{5}$, independent of other sentences. Approximate the probability that your paper contains strictly less than 40 run-on sentences.
4. Suppose $X \sim N(0, 1)$, namely X is Gaussian with mean 0 and variance 1.
 - (a) Prove by calculation that the moment generating function $M_X(t) = e^{t^2/2}$
 - (b) Using this moment generating function, find $E(X^6)$.
 (Hint: you could also compute $E(X^6) = \int_{-\infty}^{\infty} x^6 \frac{1}{\sqrt{2\pi}} e^{-x^2/2} dx$ but it would be more complicated than using the moment generating function. You may want to try Taylor expansion of the moment generating function.)
5. Suppose $X \sim \text{Uniform}[-1, 2]$ and $Y = (X - 1)^2$. Find the PDF of Y .
